

Experiment No-2

Experiment Name: Write a C program to print sum of the two numbers.

Objectives:

- Learn with C programming how to take user input using `scanf()` and display output using `printf()`.
- To learn structure a simple problem using an algorithm and flowchart with C programming.
- Ensure the program executes efficiently and produce accurate result using C programming.

Problem Analysis:

Design a program that takes two numbers input as identified as; $c(\text{int})$, $d(\text{int})$. The output of the program is to display the sum; the output parameter is identified as $\text{sum } (\text{int})$.

Input variables	Processing variables	Output variables	Header files
$c(\text{int}), d(\text{int})$	$\text{Sum} = c + d$	$\text{Sum } (\text{int})$	<code><Stdio.h></code>

Algorithms:

Step-1: Start

Step-2: Define variables: $c(\text{int})$, $d(\text{int})$, $\text{sum}(\text{int})$

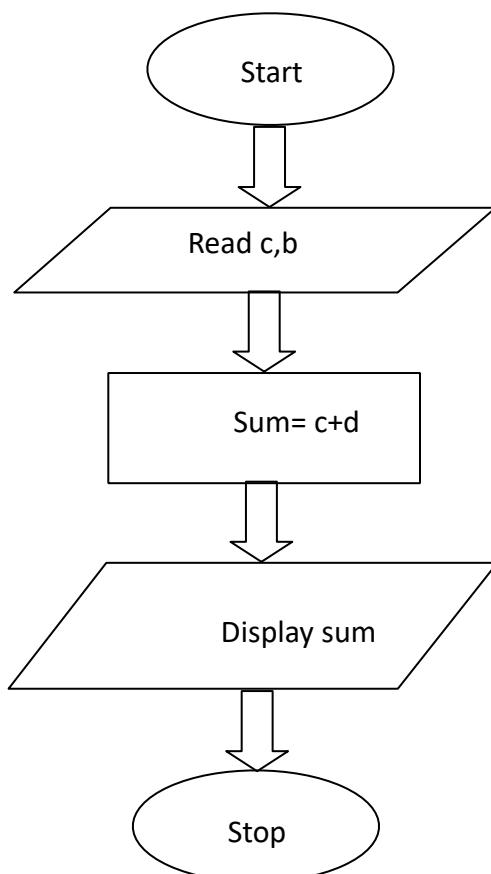

Step-3: Read value for c, d

Step-4: $\text{sum} = c + d$

Step-5: Display the sum

Step-6: Stop/End

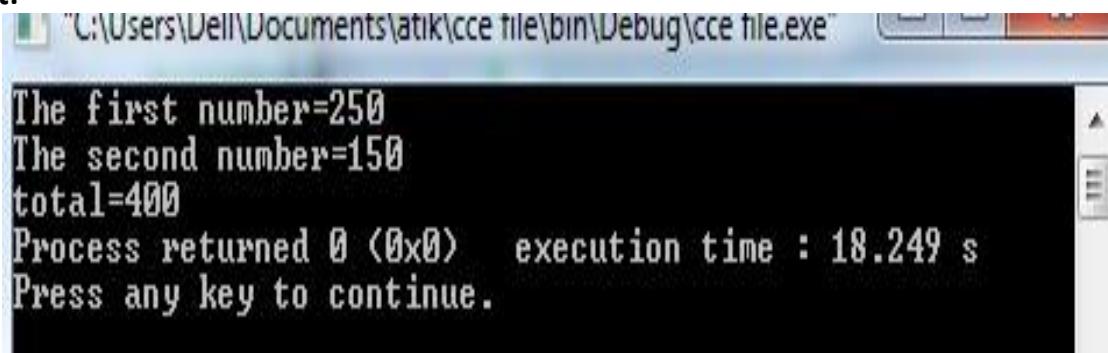

Flowchart:

Source code:

```
1 #include<stdio.h>
2 int main()
3 {
4     int c,d,sum;
5     printf("The first number=");
6     scanf("%d",&c);
7     printf("The second number=");
8     scanf("%d",&d);
9     sum=c+d;
10    printf("total=%d",sum);
11 }
12
```

Output:

```
C:\Users\...> "C:\Users\...\\cce file.exe"
The first number=250
The second number=150
total=400
Process returned 0 (0x0) execution time : 18.249 s
Press any key to continue.
```

Discussion:

In this first lab of C programming, we have learned how to solve a problem with the help of C programming. Also learned about the basic structure of C programming. To understand about C input/output functions. By experimenting I have come to understand how a calculator adds many numbers.
